Subsets With Duplicates (easy)

Problem Statement

Output: [], [1], [3], [1,3], [3,3], [1,3,3]

Given a set of numbers that might contain duplicates, find all of its distinct subsets.

Example 1:

Input: [1, 3, 3]

```
Example 2:
    Input: [1, 5, 3, 3]
    Output: [], [1], [5], [3], [1,3], [5,3], [1,5,3], [3,3], [1,3,3], [3,3,5], [1,5,3,3]
```

                                                                              Save
```

This problem follows the **Subsets** pattern and we can follow a similar **Breadth First Search (BFS)**

Solution

duplicate numbers, if we follow the same approach discussed in Subsets, we will end up with duplicate subsets, which is not acceptable. To handle this, we will do two extra things:

1. Sort all numbers of the given set. This will ensure that all duplicate numbers are next to each

approach. The only additional thing we need to do is handle duplicates. Since the given set can have

- other.

 2. Follow the same BFS approach but whenever we are about to process a duplicate (i.e., when
- the current and the previous numbers are same), instead of adding the current number (which is a duplicate) to all the existing subsets, only add it to the subsets which were created in the previous step.

 Let's take Example-2 mentioned above to go through each step of our algorithm:

Given set: [1, 5, 3, 3]

```
Sorted set: [1, 3, 3, 5]

1. Start with an empty set: [[]]
```

2. Add the first number (1) to all the existing subsets to create new subsets: [[], [1]]; 3. Add the second number (3) to all the existing subsets: [[], [1], [3], [1,3]].

[[], [1], [3], [1,3], [3,3], [1,3,3]]

Here is the visual representation of the above steps:

- 4. The next number (3) is a duplicate. If we add it to all existing subsets we will get:
- [[], [1], [3], [1,3], [3], [1,3], [3,3], [1,3,3]]
 We got two duplicate subsets: [3], [1,3]

```
Whereas we only needed the new subsets: [3,3], [1,3,3]

To handle this instead of adding (3) to all the existing subsets, we only add it to the new subsets which were created in the previous (3rd) step:
```

5. Finally, add the forth number (5) to all the existing subsets: [[], [1], [3], [1,3], [3,3], [1,3,3], [5], [1,5], [3,5], [1,3,5], [1,3,5]]

```
copy add
                                     Insert -->
      Given set:
                                                                     Note the difference for handling the duplicates
                                                  [3]
                            3 Insert -->
                                             [1]
                                                        [1,3]
                                               [1,3]
                                         [3]
                                                       [3,3]
                                                               [1,3,3]
                                   [1]
       Insert -->
        [1] [3] [1,3] [3,3] [1,3,3] [5] [1,5] [3,5] [1,3,5] [3,3,5] [1,3,3,5]
Code
Here is what our algorithm will look like:
```

Java

2
3 class SubsetWithDuplicates {
4

⊗ C++

JS JS

Python3

1 import java.util.*;

```
public static List<List<Integer>> findSubsets(int[] nums) {
           // sort the numbers to handle duplicates
           Arrays.sort(nums);
           List<List<Integer>> subsets = new ArrayList<>();
           subsets.add(new ArrayList<>());
           int startIndex = 0, endIndex = 0;
   10
   11
           for (int i = 0; i < nums.length; i++) {</pre>
             startIndex = 0;
   12
   13
             // if current and the previous elements are same, create new subsets only from the subset
             // added in the previous step
   14
   15
             if (i > 0 \&\& nums[i] == nums[i - 1])
               startIndex = endIndex + 1;
   16
             endIndex = subsets.size() - 1;
   17
             for (int j = startIndex; j <= endIndex; j++) {</pre>
   18
               // create a new subset from the existing subset and add the current element to it
   19
               List<Integer> set = new ArrayList<>(subsets.get(j));
   20
               set.add(nums[i]);
   21
   22
               subsets.add(set);
   23
   24
           return subsets;
   25
   26
   27
         public static void main(String[] args) {
   Run
                                                                                           Reset
                                                                                 Save
Time complexity
Since, in each step, the number of subsets doubles (if not duplicate) as we add each element to all
the existing subsets, therefore, we will have a total of O(2^N) subsets, where 'N' is the total number
of elements in the input set. And since we construct a new subset from an existing set, therefore, the
```

of elements in the input set. And since we construct a new statime complexity of the above algorithm will be $O(N*2^N)$.

of our algorithm will be $O(N * 2^N)$.

Space complexity#

All the additional space used by our algorithm is for the output list. Since, at most, we will have a total of $O(2^N)$ subsets, and each subset can take up to O(N) space, therefore, the space complexity
